SOP 5: System Performance Optimization (Slow Computer Fix)

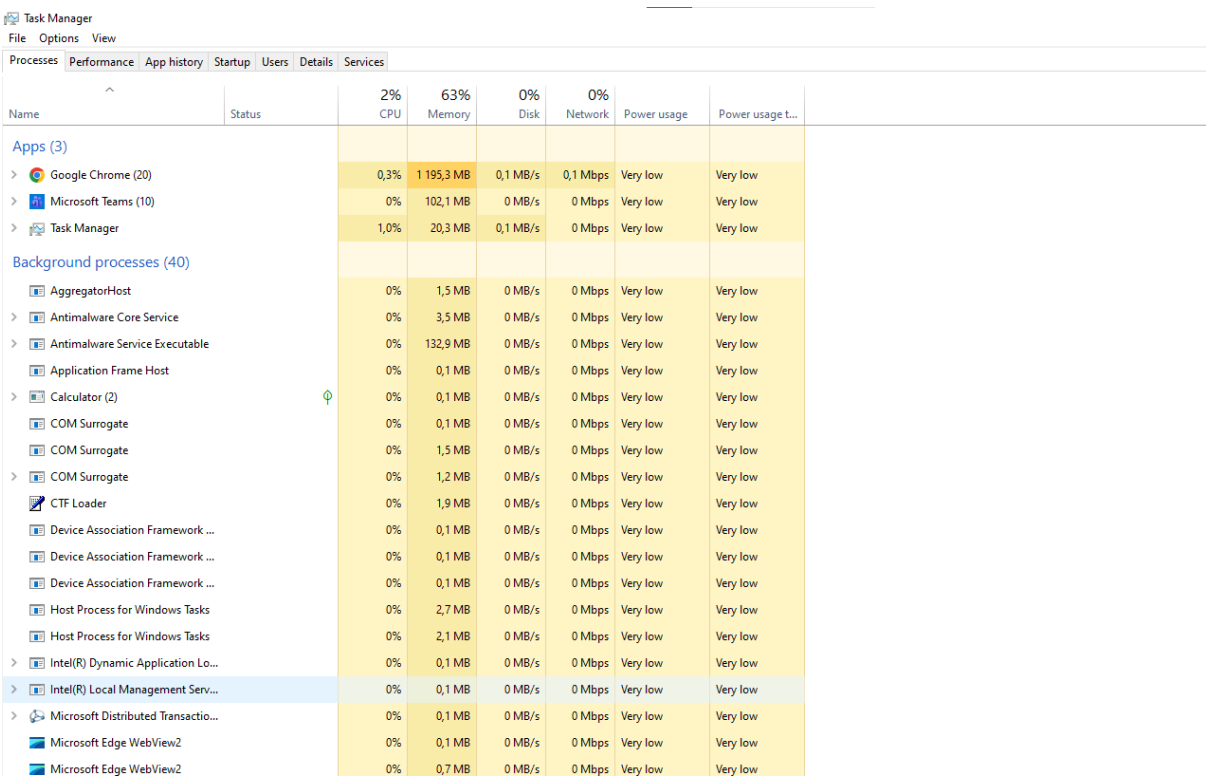
Objective: To identify resource bottlenecks and optimize system startup for improved responsiveness.

System: Windows 10/11 – Task Manager and System Settings

Drafted By: Technical Support Department

1. Real-Time Resource Monitoring

To diagnose a "slow" system, first analyse the Task Manager to identify which components are under heavy load. Check the utilization of the CPU, Memory, Disk, and Network to find the bottleneck.



Name	Status	2% CPU	63% Memory	0% Disk	0% Network	Power usage	Power usage t...
Apps (3)

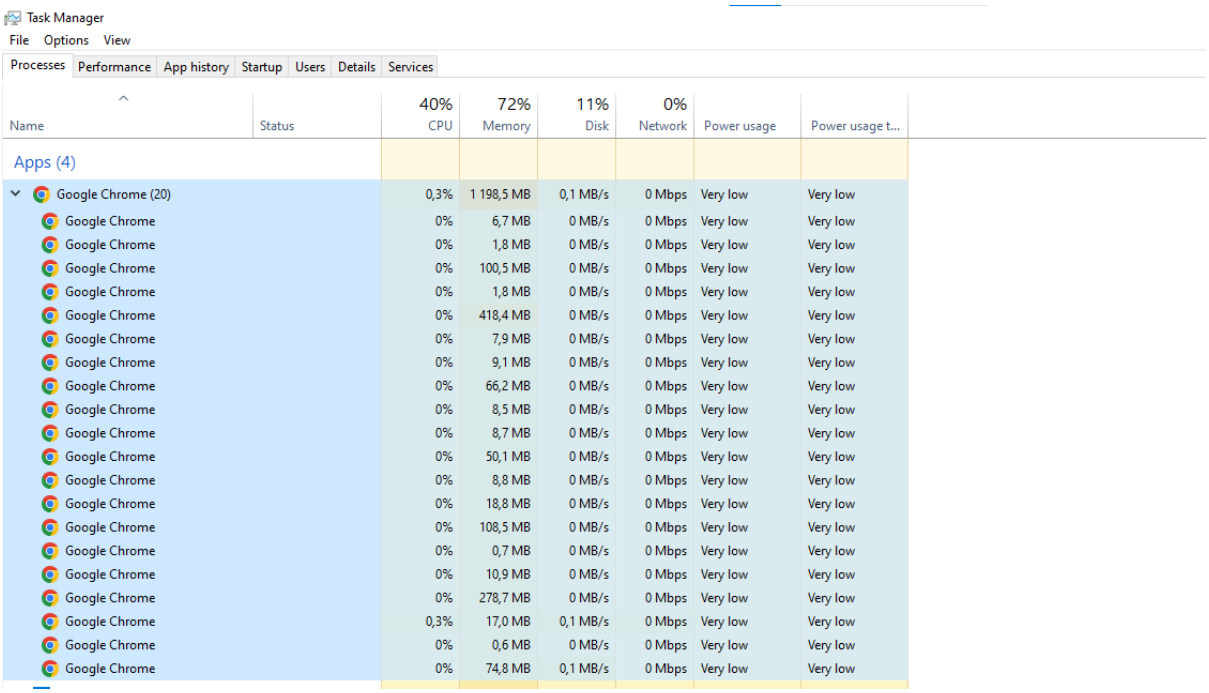
Managing Startup Impact

High "Startup Impact" applications can significantly delay system readiness after a reboot. Review the Startup tab to identify non-essential programs that launch automatically.

- Action: Locate high-impact applications that are not required for daily operations.
- Optimization: Right-click and select Disable for any third-party software that is causing unnecessary overhead



Task Manager

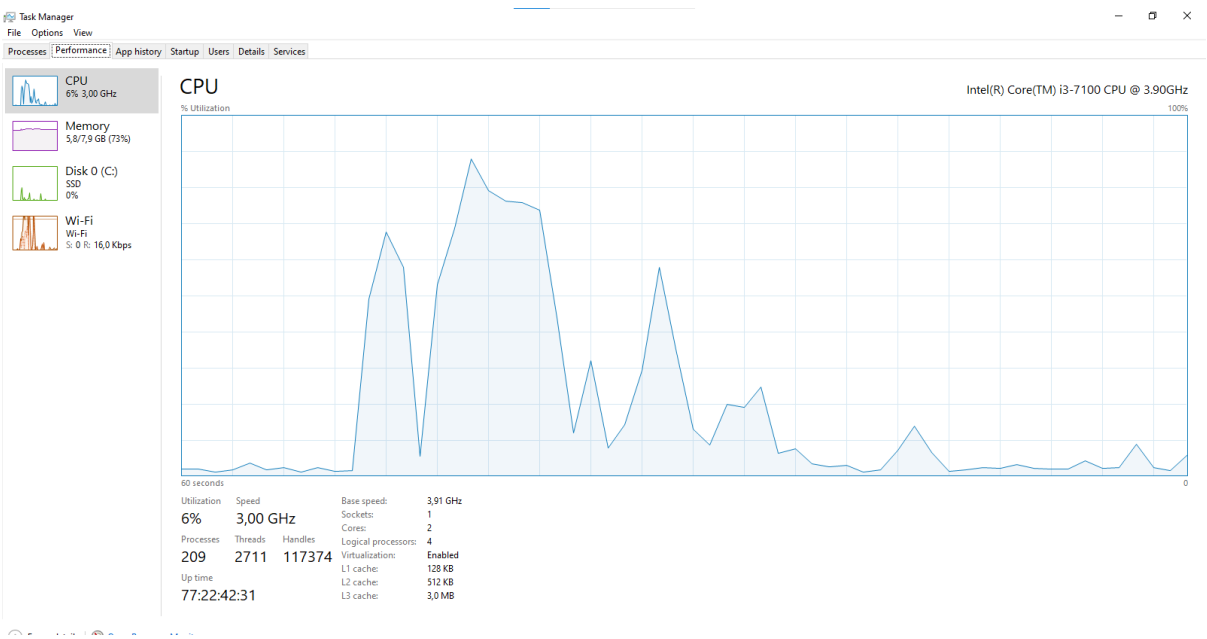
Reviewing System Specifications

Ensure that the hardware meets the requirements for the installed software. Access About your PC to verify the processor type and installed RAM. This helps determine if the slowness is due to a software issue or a hardware limitation.



Final Performance Verification

After disabling unnecessary startup items, return to the Processes tab to ensure that background tasks are no longer consuming excessive resources. A healthy system should show low CPU and Disk usage when idling.

Final Status:

The system is cleared for standard operations. It is recommended to perform this optimization audit quarterly to maintain long-term stability and prevent future performance degradation.
